

A Small Paper About Federated Learning Systems

This paper studies the behaviour of federated learning under a network that drops a large share of the client updates it carries.

We report one result.

Our method does not yet handle clients that leave in the middle of a training round, and that is the obvious next step for this work.

The left column opens the section and runs for several lines before it stops. It closes here.

The right column carries the rest of the same section and finishes the page off. It closes here too.
